

# Electronic Textiles

**...opposites attract?**

Ivo Locher

Dr. Tünde Kirstein

ICEWES'02

# Suitability ?

- **We want to determine the suitability of textiles for signal transmission in Wearables**
  - Characterization of electrical properties of conductive textiles is necessary.
  - Utilization of electrical engineering measurement methods for characterization

**Can textile replace regular printed circuit boards?**

# Speed ?

How many bits/sec can we transmit from tip to toe through textiles?

- Analog Modem 56 kbit/s
- Bluetooth 1 Mbit/s
- WLAN (IEEE 802.11) 11 Mbit/s
- LAN (Ethernet) 100 Mbit/s
- PCI Bus > 700 Mbit/s

# Textiles under Test

## Textiles used in our experiments:

- Woven fabrics with insulated metal fibers
- Metal fibers are twisted with polyester yarns
- Different yarn fineness and direction of conductive fibers

Yarn Ø	Copper fiber Ø
228µm	40µm
334µm	40µm

# Textile Geometry

## Irregularities in textile geometry

- Variations of yarn diameters (i)
- Variations of yarn distances (ii)
- Bending of yarn within plane (iii)

### Example to (i) and (ii)

dimensions	variations
$d=334\mu\text{m}$	$\sigma=28.0\mu\text{m}$
$a=876\mu\text{m}$	$\sigma=25.0\mu\text{m}$

Distributor: Elektro-Feindraht AG

### Example to (iii)

# Conductor in Yarn

- **Fibers follow a helical path within the yarn**
  - **Yarns are periodically bent in woven structure**
- ⇒ **Result: electrical length of conductive fiber is greater than length of fabric**

Yarn Ø	Length of conductive fiber compared to fabric
228μm	+7.5% (tolerance 0.5%)
334μm	+25.5% (tolerance 2.0%)

# Characterization

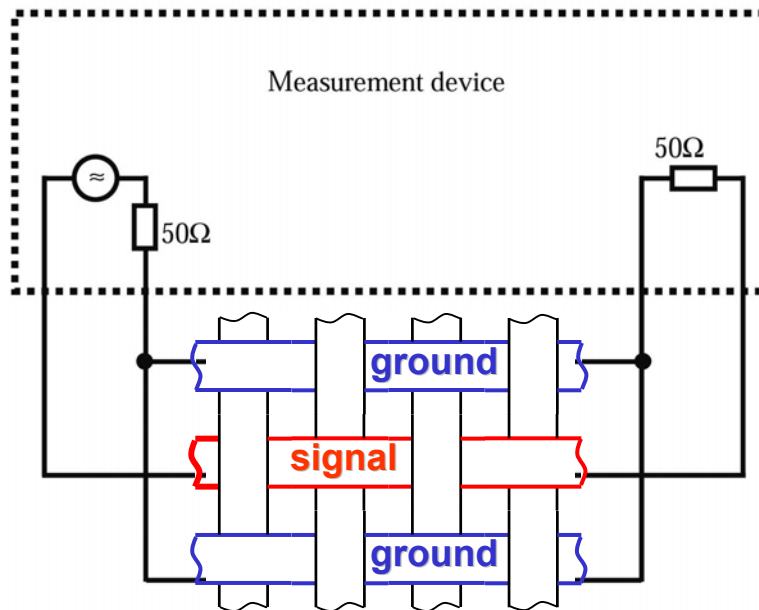

## Measurements:

- Electrical impedance
- Characteristic impedance  $Z_0$
- Frequency Response (Bandwidth)
- Cross-Talk
- Digital Signal Transmission Analysis

# Measurement Setup

- For time and frequency domain analysis
- Utilization of different number of signal line configurations

## configurations:

- **GS** (1 signal line)
- **GSG** (1 signal line)
- **GSSG** (2 signal lines)
- **GSSSG** (3 signal lines)

# Measurement Setup (cont'd)

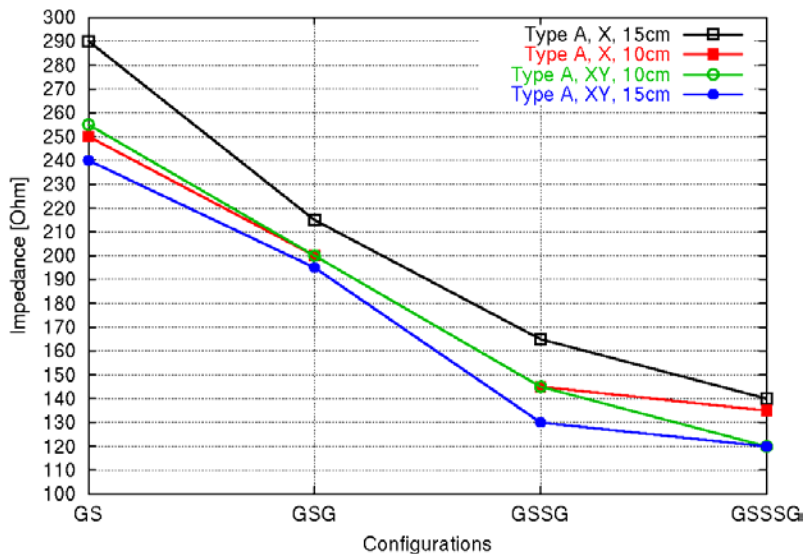

**For time and frequency domain analysis**

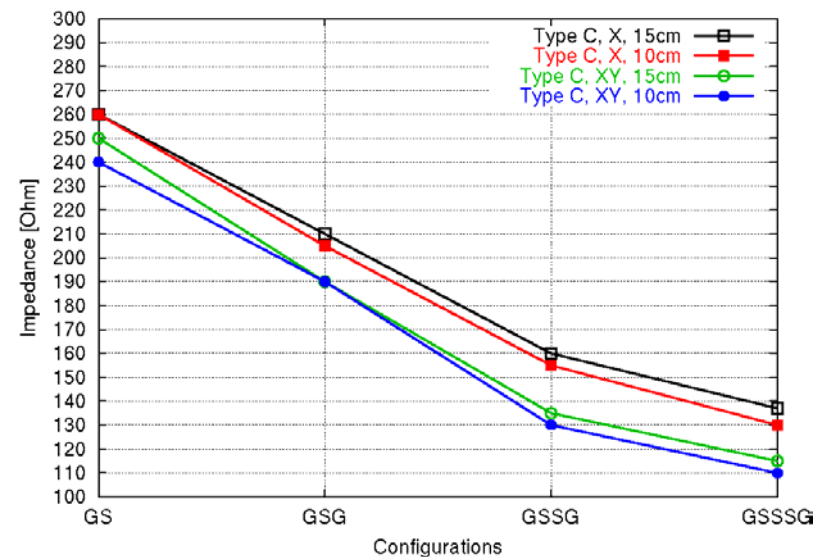

# Characteristic Impedances $Z_0$

- As number of signal lines increases, the characteristic impedance decreases.
- Impedance variations (about 10%) along the signal line caused by geometric irregularities within textile

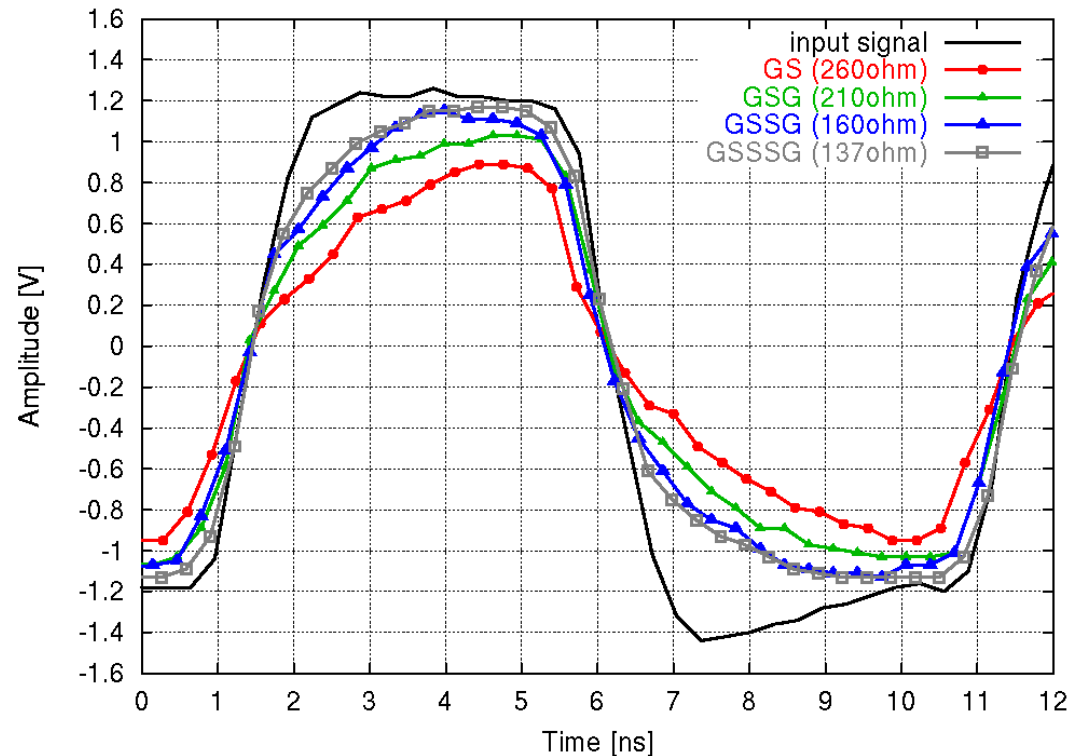

Ø 228 $\mu$ m

Ø 334 $\mu$ m

# Digital Signal Transmission

- Good signal integrity at 100MHz and 20cm line length
- As fast as LAN (Ethernet)

# Conclusions

- **We have introduced electrical engineering methods for characterization of conductive textiles**
  - Electrical Impedance
  - Characteristic Impedance  $Z_0$
  - Frequency Response
  - Cross-Talk
  - Digital Signal Transmission Analysis
- **High signal integrity up to several 100MHz.**
- **These results are fundamental for interconnections among truly wearable computers**

# Current & Future Work

- **Investigation of wearing stresses**
- **Realization of electrical circuits and connectors in textiles**
- **First applications in:**
  - Medical prevention
  - Medical monitoring

# The „Wearable Revolution“

- **Advances in:**
  - Textile technology
  - Material science
  - Computing
- **Interdisciplinary research necessary!**

**Electronic**  **Textiles**
